

MBF ESCALATE RETAIL DATAMART OR ODS™

Datamarts and Operation Data Stores deliver an integrated view of your business with quick and easy access to functional or departmental information

Don't let your business suffer because your analytical needs are not being met. Envision a solution that is scalable to any size, fits into the existing enterprise architecture, and can be modified quickly to reflect your changing environment and user requirements.

Business is about transforming data into information. Datamarts meet that need by simplifying the process of sharing information. With a predefined scope and a focused audience, you can access and manipulate data to meet your objectives. Using the desktop tools of their choice, users are not confronted with the difficult learning curves associated with new product solutions.

Designed specifically for the Escalate Retail application, MPE or Open, the MBF Escalate Retail DataMart accesses the operational data from the Escalate Retail application. The data is denormalized, transformed into usable business information and stored in a simplified structure. New and changed data is captured through transaction dates or according to your needs. Voided records are removed.

Simplified data structures, coupled with fast efficient indexing translate into 'no-wait' response times. Flexible indexing allows the datamart to be customized to match your organizational trends.

Business processes generate massive amounts of information. Datamarts deliver an integrated view of your business with quick and easy access to function or department specific information. Measure critical success factors including financial benchmarks, such as orders processed, order items, their related offers and your inventory levels.

Quick and easy access to information will improve your decision making by removing the guesswork, improve customer service by providing order status information promptly/efficiently, remove the onerous information retrieval time, and improve order process time.

Need near real-time access to datamart information? What you need is a an Operation Data Store (ODS). With enhanced technology the data mart can be updated in near real time rather than periodically, giving you almost instant access to critical information.

The MBF Escalate Retail DataMart is a seamless integration built to help you take advantage of the benefits associated with implementing a successful data mart. Business intelligence just became easier with the MBF Escalate Retail DataMart.
