

MBF-UDACONNECTOR™

Providing an ODBC client on the server as the connection between data sources on remote platforms

MBF-UDACONNECTOR is a data access layer that allows applications running on one server to access ODBC data sources on another server. It adds significant value to your existing investment in ODBC connectivity. With UDACONNECTOR you can connect to more applications on more servers and databases than ever before.

Applications on MPE, HP-UX, LINUX or Itanium can access ANY ODBC data-source on other servers that are accessible from a Windows platform. It delivers a consistent ODBC 3.5 interface to your data and can be used with ODBC 3.5, 3.0, 2.5 and 2.0 drivers.

MBF-UDACONNECTOR consists of a client that resides on MPE, HP-UX, Linux or Itanium and appears to ODBC applications like any other ODBC driver and a server that connects to the database engine as an ODBC driver.

Once installed users don't even know it exists.
