

REVEAL™ VITAL STATISTICS

“Without Vital Statistics, we would have never found out how many unneeded reports we produced, printed, microfiched and stored. We would have kept it up forever.”

Managing IT costs and improving return on IT investment is a requirement in every organization. REVEAL Vital Statistics is an essential management tool for measuring and managing return on IT spending.

Every organization has reports that were created many years ago. How can you tell if these reports are still of value?. What does it cost your company to archive reports, some of them no longer of any use? How much time and effort are put into creating and capturing obsolete reports?

Vital Statistics is a valuable management and security tool that provides answers to these questions and many more. It tracks report activity down to the user, report generation and page level, and provides both user and report information. It shows:

- How many reports and report pages are being produced and captured
- How many pages are being viewed, downloaded or printed locally
- How many pages you no longer print and how much REVEAL has saved
- Which reports are being accessed, how frequently and by whom
- Which reports can be retired because they are infrequently accessed or not accessed at all
- What is the frequency and duration of user sessions
- Who is access, prints or downloads what reports
- How long do we need to keep previous generations on-line
- Reports Fail Logons and successful Logons and their IP address
- Provides facts and figures on report usage to management
- Provides the means to comply with company security and audit requirement policies
- Provides the means to comply with HIPAA data security regulations and audit requirements
- Helps you manage licensed seat usage

“Vital Statistics gives me a the detailed information, in terms of report activity, that I have always wanted but could never get from any other system. I know exactly which report pages are downloaded, viewed or printed, allowing me to confidently report accurate results for resource planning to management. We have learned, that about 5 percent of our reports are not accessed or looked at. That kind of information is extremely useful in expense management and resource planning.”
