

REMOTE PROCEDURE CALL™ WITH COM COMPONENT BUILDER

*Protect your investment - use existing programs
with your new client-server application*

Remote Procedure Call (RPC)

RPC allows users to execute existing programs in a distributed environment. Using MB Foster's RPC and COM Builder software you can create components for existing COBOL programs and invoke them using applications such as MS Access, Visual Basic/Visual C++, ADO's, RDO's, DAO's or ODBC API calls.

Benefits

- Server independent
- Preserves the existing business logic
- Minimizes re-development effort
- Enables applications to participate in the distributed processing environment

Component Builder (COM)

A Component is the software implementation of business logic; it allows developers to rapidly deploy solutions by re-using existing code. The Component Builder is a utility which enables you to easily and affordably create components or RPCs which will update your existing applications error free.

Based upon existing business logic, the execution of code appears as if it is on your local machine, without any changes.

Benefits

- Generates COM components for calling remote procedures through MBF-UDALink
- Takes advantage of security and true authentication
- Supports up to 20 parameters in one RPC call

Employing Remote Procedure Call with COM Component Builder into your ODBC processing environments lets you take advantage of existing host based executables without re-coding. With minimal cost and a small amount of human resource time you can integrate your existing infrastructure into new technologies.
